## **Pregnancy Outcomes Within 90 Days of Vaccine Rollout**

By Craig Paardekooper (https://howbad.info)

Pregnancy cases: 274 cases including:

- 270 mother cases and 4 foetus/baby cases representing 270 unique pregnancies (the 4 foetus/baby cases were linked to 3 mother cases; 1 mother case involved twins).
- Pregnancy outcomes for the 270 pregnancies were reported as spontaneous abortion (23), outcome pending (5), premature birth with neonatal death, spontaneous abortion with intrauterine death (2 each), spontaneous abortion with neonatal death, and normal outcome (1 each). No outcome was provided for 238 pregnancies (note that 2 different outcomes were reported for each twin, and both were counted).
- 146 non-serious mother cases reported exposure to vaccine in utero without the occurrence of
  any clinical adverse event. The exposure PTs coded to the PTs Maternal exposure during
  pregnancy (111), Exposure during pregnancy (29) and Maternal exposure timing unspecified
  (6). Trimester of exposure was reported in 21 of these cases: 1st trimester (15 cases), 2nd
  trimester (7), and 3rd trimester (2).
- 124 mother cases, 49 non-serious and 75 serious, reported clinical events, which occurred in the vaccinated mothers. Pregnancy related events reported in these cases coded to the PTs Abortion spontaneous (25), Uterine contraction during pregnancy, Premature rupture of membranes, Abortion, Abortion missed, and Foetal death (1 each). Other clinical events which occurred in more than 5 cases coded to the PTs Headache (33), Vaccination site pain (24), Pain in extremity and Fatigue (22 each), Myalgia and Pyrexia (16 each), Chills (13) Nausea (12), Pain (11), Arthralgia (9), Lymphadenopathy and Drug ineffective (7 each), Chest pain, Dizziness and Asthenia (6 each), Malaise and COVID-19 (5 each). Trimester of exposure was reported in 22 of these cases: 1st trimester (19 cases), 2nd trimester (1 case), 3rd trimester (2 cases).
- 4 serious foetus/baby cases reported the PTs Exposure during pregnancy, Foetal growth restriction, Maternal exposure during pregnancy, Premature baby (2 each), and Death neonatal (1). Trimester of exposure was reported for 2 cases (twins) as occurring during the 1st trimester.

By 28<sup>th</sup> February 2021, within 90 days of vaccine rollout, Pfizer had received reports of 270 cases involving pregnancy.

Out of 270 pregnancy cases -

- 23 spontaneous abortions
- 5 outcome pending
- 2 premature birth with neonatal death
- 2 spontaneous abortion with inter-uterine death
- 1 spontaneous abortion with neonatal death
- 1 normal birth
- 238 unknown outcome

So Pfizer only had data for 27 pregnancies out of 270, since 238 had an unknown outcome, and 5 outcome pending.

Of these 27 pregnancies, there was just 1 normal birth recorded. The remaining 26 pregnancies ended in the death of the baby – that's 26 out of 27 pregnancies where they had ANY outcome data – 96% ending in baby death.

The normal rate of spontaneous abortion is 10-15% - so 96% is a safety signal – warranting an investigation of any causal link between baby deaths and the vaccine. This safety signal should alert prospective parents to be cautious.
